*NAS RK is pleased to announce that News of NAS RK. Series of geology and technical sciences scientific journal has been accepted for indexing in the Emerging Sources Citation Index, a new edition of Web of Science. Content in this index is under consideration by Clarivate Analytics to be accepted in the Science Citation Index Expanded, the Social Sciences Citation Index, and the Arts & Humanities Citation Index. The quality and depth of content Web of Science offers to researchers, authors, publishers, and institutions sets it apart from other research databases. The inclusion of News of NAS RK. Series of geology and technical sciences in the Emerging Sources Citation Index demonstrates our dedication to providing the most relevant and influential content of geology and engineering sciences to our community.*

*Қазақстан Республикасы Ұлттық ғылым академиясы "ҚР ҰҒА Хабарлары. Геология және техникалық ғылымдар сериясы" ғылыми журналының Web of Science-тің жаңаланған нұсқасы Emerging Sources Citation Index-те индекстелуге қабылданғанын хабарлайды. Бұл индекстелу барысында Clarivate Analytics компаниясы журналды одан әрі the Science Citation Index Expanded, the Social Sciences Citation Index және the Arts & Humanities Citation Index-ке қабылдау мәселесін қарастыруда. Web of Science зерттеушілер, авторлар, баспашылар мен мекемелерге контент тереңдігі мен сапасын ұсынады. ҚР ҰҒА Хабарлары. Геология және техникалық ғылымдар сериясы Emerging Sources Citation Index-ке енуі біздің қоғамдастық үшін ең өзекті және беделді геология және техникалық ғылымдар бойынша контентке адалдығымызды білдіреді.*

*НАН РК сообщает, что научный журнал «Известия НАН РК. Серия геологии и технических наук» был принят для индексирования в Emerging Sources Citation Index, обновленной версии Web of Science. Содержание в этом индексировании находится в стадии рассмотрения компанией Clarivate Analytics для дальнейшего принятия журнала в the Science Citation Index Expanded, the Social Sciences Citation Index и the Arts & Humanities Citation Index. Web of Science предлагает качество и глубину контента для исследователей, авторов, издателей и учреждений. Включение Известия НАН РК. Серия геологии и технических наук в Emerging Sources Citation Index демонстрирует нашу приверженность к наиболее актуальному и влиятельному контенту по геологии и техническим наукам для нашего сообщества.*

**DESIGN FEATURES OF A CAM-SCREW PRESS  
WITH A LARGE EFFORT**

**Abstract.** Nowadays, machine-building has become one of the main branches of the world industry with a share of about 30% of all manufactured products. Providing other industries with technological equipment for maintaining a productive work is the main task of engineering. Serial and mass production of parts with the least loss of materials and high mechanical properties are ensured by using press equipment which is included in forging and stamping equipment. Despite the long history of its existence and the works of thousands of scientists in this field, the press equipment has problems mainly in the crank press. Many works are being done in order to correct its existing shortcomings without changing the scheme of a crank press mechanism. The authors propose a fundamentally new design of a mechanical press.

This article is related to the field of metal forming by presses, particularly by mechanical presses. The paper considers the construction of the original mechanical press of a cam-screw type and provides calculations of the main design parameters of the press with a force of 400 kN. It also displays the working principle of the press. The calculations of the main parameters of a cam-screw press are considered in this article. The layout of the press with the location of the main nodes is illustrated. The height of the press is reduced by 19% compared to an analog of crank. The design of the new press is simpler and more reliable than the crank analog.

**Keywords:** mechanical press, cam-screw press, crank press, metal forming by press.

**Introduction.** Mechanical presses are considered as machine tools. In terms of their prevalence in industry, they occupy the second place after metal cutting machines and they occupy the first place among all types of forging and pressing machines [1]. It is possible to obtain details on presses which do not require significant processing, and often do not require machining by cutting operations. High productivity, the possibility of automation and its low cost are the main characteristics of the pressing equipment.

A common feature of mechanical presses is the presence of a mechanical connection (gears, shafts, levers) between the motor and the machine's actuator [1].

The modern presses are divided into 3 types: crank, hydraulic and screw press [2].

The action of the hydraulic press is based on the law of hydrostatic pressure Pascal. The pressure  $P$  which is produced by a pump is transferred to the press cylinder through a pipe by making the plunger move. An effort is increased while connecting the press plates [3].

Screw presses include technological forging and stamping machines, in which the energy of transformation is converted into useful work through a screw working mechanism [4].

Crank presses are one of the most common types of mechanical presses. The principle of operation of crank presses (presses and automatic machines) is based on the use of kinetic energy of the rotational movement of the flywheel, which is transmitted to the actuating link, the slider, with the help of a crank-slider or eccentric mechanism for deformation of the metal. During the working stroke, a part of this energy is expended on the useful work of deformation of forging [5].

Mainly crank presses are used in the metal processing by presses. A crank press drives the slider-crank mechanism, forming the work piece with the die repeatedly running at bottom dead center (BDC). Therefore, the position error of the machine, relative to BDC, directly determines the work piece accuracy [6]. However, crank presses have drawbacks, such as low productivity and low efficiency [7]. The energy efficiency of the crank press is about 20-25% [8]. Also, crank presses have a high probability of jamming. An unfavorable phenomenon such as jamming of the crank-slider mechanism in the bottom or near-to it position of the slider may arise in the presses operating in technological operations with the maximum force in the lowest position of the slider. The jamming can take place either when the slider is not reaching its lowest position, or when it goes through the lowest position [9, 10]. It is shown in the work [11] that the torque of the crank mechanism has the smallest indication in the lowest position. Crank presses are used for all types of stamping: sheet metal and volume, hot and cold, including ones which are used for separation operations. However, the crank presses are not used for free forging because of the presence of a fixed extreme working position [12].

The authors conducted a research on solving this problem, and thus the engineering and technical solutions were found. It is recommended to use new structures based on the original cam-screw mechanism [13, 14].

**Materials and methods.** The original cam-screw mechanical press was considered in these papers [15, 16]. The cam-screw press consists of the following parts (figure 1): the drive shaft 1, on which the cylinder 2 with the conical helical surface 3 with the inclination angle of the generator AE is coaxially located on the axis of the shaft 1 which equals to  $\alpha$ . The surface has a bevel at an angle  $\beta$  to the horizontal. A slider 4 which has the possibility of free vertical axial movement in the body 5 with the tool 8 is installed under the cylinder 2. A spring 7 is provided for returning it to its original position. In the upper part of the slider 4, there is a concave surface 6 which is made to contact the screw surface 3 and it has an inclination angle to the horizontal which equals to  $\beta$ . The half-coupling 11 and 12 are mounted on the shaft 1. For an actuation mechanism 10 is used for connecting them, while the spring 9 is used for separating them,  $h$  is the theoretical stroke length of the slider, the real length is less than about 0.75h.

Figure 1 – Scheme of a cam-screw press

It is important to ensure a specific pressure on the working parts that does not exceed the permissible in order to create a working press with a sufficient force. As it was already mentioned, the recommended cam-screw press has a sufficiently large contact spot in the mating links. In [15, 16], we offer formulas by which the shape and area of the contact spot can be determined. The type of the spot is shown in figure 2 by the shaded area. Figure 2 is taken from [15, 16].

Figure 2 – A scheme for determining the shape of the contact patch; the contact patch shown by the shaded area

These formulas are not entirely suitable for practical calculations of the spot area. It is possible to offer a simplified formula which is simpler and which gives a result that is sufficiently appropriate for the practice. The contact spot can be regarded as an isosceles triangle whose area  $S$  is determined from the expression which is given below:

$$L = 2R\pi \frac{2\varphi}{360^\circ}$$

$$S = 0,75 \cdot B \cdot L \cdot 0,5 = 0,75 \cdot B \cdot L \cdot 0,5 \cdot 2R\pi \frac{2\varphi}{360^\circ} = 1,5BR\pi \frac{\varphi}{360^\circ}$$

$B$  – the length of comb, mm (figure 3,4);  $R$  – average radius, mm;  $\varphi$  – angle, degree.

The following values of the design parameters are recommended for the press with the force of 400 kN:

$$B = 60 \text{ mm}, R = 200 \text{ mm}, \varphi = 40^\circ, S = 6283 \text{ mm}^2$$

The specific normal stress is determined by the formula [17]:

$$\sigma = \frac{P}{S} = \frac{400000}{6283 \cdot 10^{-6}} = 63,66 \cdot 10^6 \approx 64 \text{ MPa}$$

The maximum permissible normal stress for structural steel is not about 300 MPa [18]. The permissible voltage for normal long-term operation of the mechanism is not more than 65 MPa. As it can be seen, the normal stress in the press mechanism is less.

Figure 3 – Simplified form of contact patch

Figure 4 – A scheme for calculating the area of the contact patch

Let us determine the power of the press engine. In [15, 16], there is a formula for calculating the force of the press  $P_0$ :

$$P_0 = \frac{M \cdot \frac{h1}{h}}{(R_0 + \frac{t \cdot \text{tg} \alpha \cdot \varphi i}{360^\circ}) \cdot \text{tg} \gamma \cdot \text{tg}(\beta + \psi)} + \frac{M \cdot \frac{h2}{h}}{(R_0 + \frac{t \cdot \text{tg} \alpha \cdot \varphi i}{360^\circ}) \cdot \text{tg}(\alpha_a + \psi)}$$

In this formula:  $R_0 = \frac{t \cdot \text{tg} \alpha \cdot \varphi i}{360^\circ} = R_{cp}$  while  $\varphi i = 180^\circ$ , consequently, the formula can be simplified by the following way:

$$P_0 = \frac{M \cdot \frac{h1}{h}}{R_{av} \cdot \text{tg} \gamma \cdot \text{tg}(\beta + \psi)} + \frac{M \cdot \frac{h2}{h}}{R_{av} \cdot \text{tg}(\alpha_a + \psi)}$$

where  $\psi$  – angle of friction,  $\psi=1,5^\circ$ , angle of friction takes into account the friction between surfaces, thus the less friction, the smaller the angle

$$h1 = l_{px} \cdot \text{tg} \beta; h2 = l_{px} \cdot \text{tg} \alpha; h = h1 + h2$$

$$l_{px} = 0,9t$$

$$\text{tg} \gamma = \frac{t}{2\pi R_{av}}$$

$$\text{tg} \alpha_a \approx \frac{\Delta R}{2\pi R_{av}} = \frac{t \cdot \text{tg} \alpha}{2\pi R_{av}} \quad (\text{figure 1})$$

$R_{av}$  – average radius of Archimedes' spiral,  $\Delta R$  - an increase in the radius of the Archimedes' spiral in one turn.

We take the following values for the press:

Engine power  $N=11$  kW (11000 W), rotation frequency of  $n_e=750$  min<sup>-1</sup>,  $\psi=1,5^\circ$ ;  $\alpha=9^\circ$ ;  $\beta=7^\circ$ ,  $R_{av}=200$  mm,  $t=155$  mm. Rotation frequency of the press shaft  $n=100$  min<sup>-1</sup>.

The torque on the shaft of the press is equal to:

$$M = \frac{N}{\omega} = \frac{N}{0,1n} = \frac{11000}{0,1 \cdot 100} = 1100 \text{ Hm}$$

Angle  $\gamma$

$$tg\gamma = \frac{t}{2\pi R_{av}} = \frac{155}{2 \cdot 3,14 \cdot 200} = 0.123$$

$\gamma=7^\circ$

$$h1 = l_{px} \cdot tg\beta = 0,9t \cdot tg\beta = 17,13 \text{ mm}$$

$$h2 = l_{px} \cdot tg\alpha = 0,9t \cdot tg\alpha = 22,1 \text{ mm}$$

$$h = h2 + h1 = 39,23 \text{ mm}$$

$$tg\alpha_a \approx \frac{\Delta R}{2\pi R_{av}} = \frac{t \cdot tg\alpha}{2\pi R_{av}} = \frac{155 \cdot 0,158}{2 \cdot 3,14 \cdot 200} = 0.0195$$

$$\alpha_a=1,1^\circ$$

$$P_0 = \frac{M \cdot \frac{h1}{h}}{R_{av} \cdot tg\gamma \cdot tg(\beta + \psi)} + \frac{M \cdot \frac{h2}{h}}{R_{av} \cdot tg(\alpha_a + \psi)} = \frac{1100 \cdot \frac{17,13}{39,23}}{0,2 \cdot 0,12 \cdot 0,15} + \frac{1100 \cdot \frac{22,1}{39,23}}{0,2 \cdot 0,046} = 198019 \text{ H}$$

The rated force of the press is  $P_0=198019$  H. Due to the inertial force of the flywheel, it is able to develop a force of up to 400,000 H. The rated force is half of the nominal stroke of the slider  $h = 39$  mm.

For comparison, the KD2126 series of the crank press with a nominal effort  $P_1=400000$  H has an engine with a power of  $N_1=4700$  W and a main shaft speed of  $n_1=100$  min<sup>-1</sup>, with a stroke of 10 mm, the crank length  $r = 5$  mm [19]; according to the calculation, the force  $P_{1P}=94000$  H can be developed, that is less than a quarter of the declared nominal effort.

$$P_{1P} = \frac{N_1}{0,1 \cdot n_1 \cdot r} = \frac{4700}{0,1 \cdot 100 \cdot 0,005} = 94000 \text{ H}$$

**Results and discussions.** Based on the presented calculations, the following parameters of the press design are proposed with a nominal force of 400 kN (table).

Parameters of the press design

#	Name	Unit of measurement	Value
1	Nominal effort	kN	400
2	Estimated effort	kN	198
3	Electric motor power	W	11000
4	Rotational speed of the press shaft	min <sup>-1</sup>	100
5	Slider stroke	mm	39
Geometrical parameters of the cam-screw surface			
6	Average radius	mm	200
7	Step	mm	155
8	Length of comb	mm	60
9	Angle $\alpha$	degree	9
10	Angle $\beta$	degree	7
11	Angle $\gamma$	degree	7

Figure 5 shows a slightly modified layout of the press. It is recommended to position the guide rollers 13 on the slider 4, which move freely vertically in the upper part of the carcass 5 in order to reduce the height of the press and simplify the manufacturing process. There are return springs 7 on the jacks 13. The pallets 14 are mounted to the bottom of the slider 4. This circuit has a lower height and it allows create a closed space around the cylinder 2, surfaces 3 and 6, a roller 13 that can be filled with an oil and which will significantly improve the working conditions of the parts of the press.

Figure 5 – Scheme of press with a reduced height

Figure 6 shows the main assembly of the press while figure 7 illustrates a general view of a section with the main structural dimensions. It is recommended to use an electromagnetic coil 5 for closing the cam clutch 4.

Figure 6 – The main press unit with a force of 400 kN

Figure 7 – General view of the press: 1 - corpus, 2 - shaft, 3 - cam-helical surface, 4 - cam clutch, 5 - electromagnetic coil.

Dimensions of the press 995x1020x2160 mm. For comparing the dimensions of the existing press KD2126–1330x1380x2680 [19]. As it can be seen, the proposed press is much smaller than the existing one; its height is less by 520 mm or by 19%. While designing the workshops, the height of the building's span is assigned to the height of the highest equipment required for installation [20]. Thus, a large press height can significantly increase the costs for constructing the workshops and transporting the equipment.

**Conclusions:** The calculations of the main parameters of a cam-screw press with a force of 400 kN have been performed, the main design of the parameters and dimensions have been obtained. The layouts of the press as well as the location of all its main components and details have been worked out. The recommended design of the press is differed by its simplicity and reliability, the height of the press is reduced by 19% compared to the existing press model KD2126.

### **ҮЛКЕН КҮШІ БАР ЖҰДЫРЫҚШАЛЫ-БҰРАМАЛЫ ПРЕССТІҢ КОНСТРУКТИВТІ ЕРЕКШЕЛІКТЕРІ**

**Аннотация.** Қазіргі заманда машинажасау өндірілетін өнімнің 30% үлесімен әлемдегі өндірістің басты салаларының бірі болып табылады. Басқа салаларды технологиялық жабдықтармен қамтамасыз ету машинажасаудың басты мақсаты болып табылады. Ұсталық-қалыптау жабдықтарының құрамына кіретін пресстік жабдықтарды қолдану арқылы аз материал шығыны мен жоғары механикалық қасиеттері бар сериялық және массалық тетіктер өндірісін қамтамасыз етеді. Ұзақ тарихы және мыңдаған ғалымдардың осы салада жұмыс жасауына қарамастан пресстік жабдықтардың кемшіліктері бар, әсіресе, қосиінді прессте. Көптеген жұмыстар бар кемшіліктерді қосиінді пресстің механизмін өзгертпестен іске асырылуда. Авторлар жаңа конструкциялы механикалық прессті ұсынады.

Осы мақала металды қысыммен өңдеу, оның ішінде механикалық пресстер саласына жатады. Жұмыста жұдырықшалы-бұрамалы типті түпкі механикалық пресстің конструкциясы қарастырылған, 400 кН қысу күші бар пресстің негізгі конструктивті көрсеткіштерінің есептеулері берілген. Пресстің жұмыс жасау принципі көрсетілген. Мақалада жұдырықшалы-бұрамалы пресстің негізгі көрсеткіштерінің есептеулері қарастырылған. Негізгі тораптарының орналасуы бар пресстің құрастырылымы көрсетілген. Қосиінді аналогымен салыстырғанда пресстің биіктігі 19% азайтылған. Жаңа пресстің конструкциясы қосиінді аналогынан оңай және сенімдірек.

**Түйін сөздер:** механикалық пресс, жұдырықшалы-бұрамалы пресс, қосиінді пресс, металды қысыммен өңдеу.

### **КОНСТРУКТИВНЫЕ ОСОБЕННОСТИ КУЛАЧКОВО-ВИНТОВОГО ПРЕССА С БОЛЬШИМ УСИЛИЕМ**

**Аннотация.** В настоящее время машиностроение является одним из главных отраслей в мировой промышленности с долей около 30% от всей производимой продукции. Обеспечение других отраслей технологическим оборудованием для продуктивной работы является главной задачей машиностроения. Серийное и массовое производство деталей с наименьшими потерями материалов и с высокими механическими свойствами обеспечиваются путем применения прессового оборудования, входящего в состав кузнечно-штамповочного оборудования. Несмотря на длинную историю существования, работу тысяч ученых в этой области, у прессового оборудования имеются проблемы, особенно у кривошипного пресса. Много работы ведется по исправлению существующих недостатков, без изменения схемы механизма кривошипного пресса. Авторы предлагают принципиально новую конструкцию механического пресса.

Данная статья относится к области обработки металлов давлением, в частности, к механическим прессам. В работе рассмотрена конструкция оригинального механического пресса кулачково-винтового типа, даны расчеты основных конструктивных параметров пресса усилием 400 кН. Показан принцип работы пресса. Рассматриваются расчеты основных параметров кулачково-винтового пресса. Показана компоновка пресса с расположением основных узлов. Высота пресса уменьшена на 19% по сравнению с аналогичным кривошипным. Конструкция нового пресса проще и надежнее кривошипного аналога.

**Ключевые слова:** механический пресс, кулачково-винтовой пресс, кривошипный пресс, обработка металлов давлением.

**Publication Ethics and Publication Malpractice  
in the journals of the National Academy of Sciences of the Republic of Kazakhstan**

For information on Ethics in publishing and Ethical guidelines for journal publication see <http://www.elsevier.com/publishingethics> and <http://www.elsevier.com/journal-authors/ethics>.

Submission of an article to the National Academy of Sciences of the Republic of Kazakhstan implies that the described work has not been published previously (except in the form of an abstract or as part of a published lecture or academic thesis or as an electronic preprint, see <http://www.elsevier.com/postingpolicy>), that it is not under consideration for publication elsewhere, that its publication is approved by all authors and tacitly or explicitly by the responsible authorities where the work was carried out, and that, if accepted, it will not be published elsewhere in the same form, in English or in any other language, including electronically without the written consent of the copyright-holder. In particular, translations into English of papers already published in another language are not accepted.

No other forms of scientific misconduct are allowed, such as plagiarism, falsification, fraudulent data, incorrect interpretation of other works, incorrect citations, etc. The National Academy of Sciences of the Republic of Kazakhstan follows the Code of Conduct of the Committee on Publication Ethics (COPE), and follows the COPE Flowcharts for Resolving Cases of Suspected Misconduct ([http://publicationethics.org/files/u2/New\\_Code.pdf](http://publicationethics.org/files/u2/New_Code.pdf)). To verify originality, your article may be checked by the Cross Check originality detection service <http://www.elsevier.com/editors/plagdetect>.

The authors are obliged to participate in peer review process and be ready to provide corrections, clarifications, retractions and apologies when needed. All authors of a paper should have significantly contributed to the research.

The reviewers should provide objective judgments and should point out relevant published works which are not yet cited. Reviewed articles should be treated confidentially. The reviewers will be chosen in such a way that there is no conflict of interests with respect to the research, the authors and/or the research funders.

The editors have complete responsibility and authority to reject or accept a paper, and they will only accept a paper when reasonably certain. They will preserve anonymity of reviewers and promote publication of corrections, clarifications, retractions and apologies when needed. The acceptance of a paper automatically implies the copyright transfer to the National Academy of Sciences of the Republic of Kazakhstan.

The Editorial Board of the National Academy of Sciences of the Republic of Kazakhstan will monitor and safeguard publishing ethics.
